Motor vehicle crashes remain the No. 1 cause of death for adolescents. Teen drivers (ages 16 to 19) are involved in fatal crashes at four times the rate of adult drivers (ages 25 to 69). Many teen driver-related injuries and deaths are preventable. The Children’s Hospital of Philadelphia (CHOP) and State Farm Insurance Companies® are committed to helping teens stay safe on the road. Through a unique academic-industry alliance called the Young Driver Research Initiative (YDRI), we are working to advance science to reduce teen driver-related crashes. This science fuels our efforts to develop and disseminate evidence-based interventions, education, and policy to promote safe driving-related behaviors among teens and their parents.

Key Findings

Analyses of the NYDS data are helping YDRI researchers develop effective interventions, education, and policy for teens and their parents. Key findings highlighted in this report include:

- Teens don’t consider themselves inexperienced drivers. Although 60 percent of teens believe inexperience heavily influences safety, only 15 percent consider their peers to be inexperienced.
- Parents play a crucial role in teen driving safety. Teens who say their parents set rules and monitor their driving activities in a helpful, supportive way are half as likely to be in a crash and 71 percent less likely to drive intoxicated than teens who describe their parents as less involved.
- Limiting primary access to vehicles during the first 6 to 12 months of driving is important. Teens who are the main driver of a vehicle are more than twice as likely to report having been in a crash than teens who share a car with family members. Since nearly three out of every four teens in the U.S. are the main driver of a vehicle according to our survey, this represents a significant opportunity for parents to control a major crash factor.
- Unlicensed teen drivers engage in more unsafe driving behaviors than licensed teen drivers. This includes not wearing safety belts and speeding, which may explain why these teens are overrepresented in fatal crashes.

Due to the complexity of the “teen driver problem,” most experts advocate for a comprehensive approach, one that addresses not only driving concerns, but also adolescent cognitive, emotional, and social development. To answer this call to action, we assembled a multidisciplinary team comprised of experts in the fields of injury prevention; traffic safety; adolescent health; advocacy; behavioral science; biostatistics; communications; education; engineering; epidemiology; and public health. The team brings together the strengths of the nation’s leading children’s hospital and research institute with the nation’s largest auto insurer. YDRI employs a comprehensive, rigorous method to analyze factors associated with teen crashes and develop interventions to change behaviors that contribute to these crashes, positioning the alliance as a unique contributor to the field of teen driver safety research.

Central to our research is the Teen-Centered Method. To get the teen viewpoint on driving, in 2006 we conducted 45 focus groups with teens across the country to create the National Young Driver Survey (NYDS). This landmark survey was administered in 68 randomly selected public high schools across the country that agreed to participate. Within each school, one ninth grade classroom, two 10th grade classrooms, and one 11th grade classroom were randomly chosen for a total sample of 5,665 students. The weighted data are representative of all 10.6 million public high school students in the U.S. It is the most comprehensive current description of youth perceptions of teen driving.
A total of 5,665 students responded to our survey. All data described in this report are weighted, meaning that the sample is representative of all 10.6 million U.S. public school students in the ninth through 11th grades. Our sample includes teens who have never driven, are learning to drive, and drive independently. Please see the Methods section on Page ?? for a more detailed description of the sampling and weighting plan.

Experience With Driving

- Fifty-six percent of surveyed teens have learned or are learning to drive with their mom, dad, both parents or stepparents.
- Fifty-six percent of drivers (those learning to drive or who drive on their own) have had at least some type of formal driver education, including classroom-based or behind-the-wheel instruction.
- Thirty-four percent of drivers have had more than one type of instruction.

Driving Status by Grade

- Nearly three-fourths of ninth through 11th graders are learning to drive or are already driving.
- More than half of ninth graders say they are drivers.
- Two-thirds of 11th graders say they drive on their own, twice the proportion of 10th graders.
- Only 10 percent of 11th graders do not drive.

Driving Status by Race/Ethnicity

- Driving status is similar for whites and blacks.
- Hispanic teens are less likely to be driving than white or black teens.

Driving Status by Gender

- Boys tend to learn to drive and receive their licenses at an earlier age than girls.
**Distractions can be deadly.**

Teens need to keep their focus on the road. Since most teens lack driving experience, anything that lessens that focus can be a dangerous distraction. Of the top 25 factors teens believe affect safety, 17 cause the driver to become distracted. Eleven take the driver’s eyes and focus off the road (e.g., texting, talking on a cell phone, teen passengers). Of these, five are actions the driver is directly responsible for taking, and six are related to passengers.* Six other factors reduce the driver’s ability to concentrate on the road (e.g., drinking while intoxicated, tired, or highly emotional).

Interestingly, 25 percent of teens report that when parents are passengers in their car, it makes them nervous and serves as a major factor in driving safety. While this may have implications for meaningful practice driving, previous research shows that drivers are at their lowest lifetime crash risk during the supervised learner period.

* Dancing or singing along to the music is done by both drivers and passengers.
If we understand teens’ misperceptions, we can address them. The teens revealed a striking lack of awareness of how inexperience among teen drivers affects safety. Although 60 percent believe inexperience heavily influences safety, only 15 percent report exposure to inexperienced drivers (despite the fact that nearly all teenage drivers are inexperienced). To know how to address this knowledge gap, we need to better understand what teens believe merits “experience” and to develop ways to correct any misconceptions. Our qualitative research suggests some teens believe getting a license makes them experienced. We need to help them understand that the experience needed to become a good driver is gained way beyond licensure and to encourage gaining this experience in the most effective ways.

Public health messages need to be targeted to various teen groups. Our study found that certain teen populations do not clearly understand the potential dangers of certain crash risks, such as speeding and intoxicated driving. This may be because public health messages are not fully resonating with them.

Subgroups of teens see risk differently. No teen passenger wants to be responsible for causing a crash that hurts or kills a friend. African-American teens are somewhat more likely to report seeing peers drink and drive than Caucasian teens. Caucasian teens are less likely to view speeding as hazardous than African-American and Hispanic teens.

A CALL TO ACTION

- Include teens in policy and program development around driving. Value their wisdom but address their misperceptions regarding driving safety, particularly inexperience. Download “What Experience Means for Driving.”
- Reinforce messages that highlight the dangers of driving while intoxicated and encourage seat belt use. Add new messages about the dangers of driving while talking or texting on a cell phone and other distractions, including other teen passengers. Download “Risk Factors” and “Teach Your Teen to be a Safe Passenger.”
-Advocate for strong Graduated Driver Licensing (GDL) laws in your state. Download “Graduated Driver Licensing.”

Downloadable resources to share with families are available at www.chop.edu/youngdrivers and www.statefarm.com/teendriving.
Researchers have long known that parenting style (the parents’ approach to raising their teens) has a strong influence on the likelihood of teens avoiding or taking part in risky behaviors, such as smoking or drinking. This paper takes this concept further, adding teen driver safety to the list of health behaviors that parenting style can affect. These findings make a significant contribution to a small but growing body of research linking parenting style and teen driver safety. Parenting style matters, according to teens, and it may even save their lives by lowering crash risk.

What the survey asked.
In order to understand the link between parenting style and driving, the NYDS survey asked teen respondents to assess their parents according to the following four statements:

- My parents give me help and support when I need it.
- In my family, there are clear rules about what I can and cannot do.
- My parents keep track of where I am when I am not in school and away from home.
- My parents want to know who I am with when I am not in school and away from home.

Parenting Styles: The Balance Between Support and Control

The Permissive Parent is highly supportive but makes few rules and trusts rather than monitors.

“I trust you’ll do the right thing.”

The Authoritative Parent is highly supportive AND closely monitors and sets rules.

“I care, and I’ll give you the freedoms you earn; but, for safety-related issues, you’ll do as I say.”

The Uninvolved Parent sets few rules, does not monitor, and offers little active support.

“Kids will be kids—You’ll learn from your mistakes.”

The Authoritarian Parent sets many rules and closely monitors but offers little support.

“You’ll do as I say.”

Parents play a very important role in raising safe teen drivers, from before they learn to drive and beyond licensure.
What does it mean to be a supportive parent?

"Parental support" can be defined in many ways. A growing body of literature finds that teens who describe their parents as "supportive" are loving and involved.

Parenting style can affect a teen’s crash risk.

 Teens who say their parents set rules and monitor where they are going and with whom in a helpful, supportive way are half as likely to be in a crash and 71 percent less likely to drive intoxicated than teens who describe their parents as less involved (offer little support, do not set rules or monitor).

Support alone isn’t good enough when it comes to driving safety.

 Teens who describe their parents as permissive do not significantly differ in crash risk or safety belt use from those teens who view their parents as uninvolved.

Rules and monitoring matter.

■ Teens who say their parents are authoritarian or authoritative are nearly twice as likely to wear a safety belt as a driver or passenger as teens who say their parents are uninvolved.

■ These teens are also nearly twice as likely to believe that buckling up affects safety as compared to teens who perceive their parents as uninvolved.

■ Teens who report having authoritative parents speed about half as often as teens who view their parents as permissive or uninvolved.

Parents who monitor and set appropriate rules in a supportive way protect their teens.

Authoritative parents do provide a protective effect on safety. But authoritative parents have a significantly higher effect on safety.

It’s about safety, not control.

Setting and enforcing rules and monitoring teens’ driving habits are most effective in reducing crash risk when teens understand that these limits are in place because their parents care about them and want them to be safe.

Parents may cut their teen drivers’ crash risk in half if they set driving rules and monitor them in a supportive, non-controlling way.

New views on parental monitoring

"Monitoring" used to mean parents keeping tabs on their teens’ whereabouts at all times and “doing as they say” no matter what. New research suggests that it’s more important for teens to disclose information to their parents than the actual act of monitoring. Parents who show an active and genuine interest and clearly show that their concerns are about safety are more likely to have this information shared with them.

A CALL TO ACTION

■ Help parents understand the importance of providing teens with lots of varied and supervised practice while learning to drive and careful monitoring for the first year after licensure. Download “Driving Practice Log” and “Driving Lesson Timeline: A Coaching Guide for Parents.”

■ Work with parents to help them set limits with teen drivers during their first year behind the wheel and to gradually introduce new privileges as they are earned. Download “Set House Rules and Reduce Crash Risk for Your Teen.”

■ Encourage parents to be role models and to be supportive, yet firm, with their teens. Download “Authoritative Parenting Tips.”

Downloadable resources to share with families are available at www.chop.edu/youngdrivers and www.statefarm.com/teendriving.
In this study we looked at a key decision faced by families: When considering safety issues, should teens be the main driver of a vehicle or should they share a car with other family members? We wanted to explore the impact of this decision on risky driving behavior and crashes. Primary access is defined as being the "main driver" of a vehicle rather than sharing a vehicle with other family members. Nearly three of every four teens in the U.S. (2.2 million 9th to 11 graders) have primary access to a vehicle. Teens with primary access drive more than teens with shared access, an average of 6.6 hours (an estimated 200 miles per week), compared to 4.3 hours (an estimated 130 miles per week).

The majority of teens with primary access to vehicles are A/B students and hold down jobs.

When compared to teens who share vehicles, those with primary access are more likely to speed and use cell phones, which explains, in part, why they are twice as likely to crash.

Teens with primary access to a vehicle are more than twice as likely to use cell phones while driving and to speed than their peers who share a car, two known factors that make crashes more likely.

Teens with primary access to a vehicle are more than twice as likely to report having been in a crash than those who share a car.

No difference could be detected between teens with primary vs. shared access to a vehicle with regard to alcohol use while driving and safety belt use.

Model controlled for amount of hours driven per week.
Closer Monitoring

When teens have to share a car, they have to ask for it. This request for the car naturally leads to an opportunity for parents to monitor their teen’s driving. When teens are the main drivers of vehicles, it may lead to less monitoring by parents. Also, teen drivers with primary access to a vehicle may become the neighborhood chauffeur. Transporting peer passengers is a common factor associated with teen crashes.

A CALL TO ACTION

- Encourage parents to control the keys. Limiting how much a teen drives is one way parents can affect a major crash factor. A teen with easy access to the keys is more than twice as likely to crash as a teen who shares a car with family members. Download pages 14-17 from “Driving: Through the Eyes of Teens, A Closer Look.”

Downloadable resources to share with families are available at www.chop.edu/youngdrivers and www.statefarm.com/teendriving.

Unlicensed teen drivers engage in more unsafe driving behaviors than licensed teen drivers. These are behaviors known to increase the likelihood of injury or death if a crash occurs, for example: not wearing safety belts and speeding. There also are behaviors known to raise the risk of crashing, for example: driving under the influence of alcohol or drugs and driving while drowsy. The NYDS revealed that unlicensed drivers are significantly less likely to wear seat belts (raising their risk of injury or death) and more likely to drive under the influence of alcohol or drugs (raising their risk of crashing).
Unlicensed teen drivers are overrepresented in fatal crashes. While 6 percent of 9th to 11th graders report unlicensed driving in our survey, 18 percent of 14 to 18-year-old drivers involved in fatal crashes in 2006 did not have a valid license. (Data from the Fatality Analysis Reporting System – FARS – operated by the National Highway Traffic Safety Administration)

Unlicensed teen drivers are more likely to identify themselves as African-American or Hispanic, to live in central city or rural districts, and to report lower grades in school. This group may represent a diverse population: high-risk drivers, as well as those needing to drive but unable to obtain or maintain licensure, possibly due to socioeconomic reasons.

The graduated licensure process provides an opportunity to teach and practice safety.

Factors Associated with Unlicensed Teen Driving

Why does getting a license matter?

The licensure process provides an opportunity to promote safety. We need to develop effective outreach programs that guide all teens successfully through the licensure process. While a license itself does not offer enhanced safety, the licensure process may be protective if it exposes teens and their parents to graduated driver licensing (GDL) laws and practices, as well as to a more systematic learning-to-drive process.

What keeps a teen from getting a license?

While this study began to quantify the problem and impact associated with unlicensed teen drivers, further research is needed to better understand barriers to licensing, both related and not related to driving, and ways to get all teens into the licensing system. In particular, policies that impose fines for infractions should be reassessed. All teens should be able to learn how to become safe drivers regardless of their ability to pay.

Addressing the issue

Future research and outreach directed at teens from central city and rural areas may help us lower their crash injury and fatality risk. We need to better understand the barriers teens face in obtaining a license to develop effective interventions that promote safe driving.

A CALL TO ACTION

- Include teen driver safety as an important part of high school Health curricula. Educators should steer students towards the formal licensing process and provide information about the required amount of behind-the-wheel practice and the dangers of unlicensed driving.
- Address issues in state/local license suspension policies that might make it difficult for some groups of teens to obtain a license and legally drive.
- Clinicians should consider screening for unlicensed driving when discussing health risk factors with adolescents. If identified, clinicians should counsel teens and their families about the importance of GDL and address unsafe driving behaviors.

Downloadable resources to share with families are available at www.chop.edu/youngdrivers and www.statefarm.com/teendriving.

Because this paper determined the prevalence and associated risk factors for unlicensed driving among 9th through 11th graders, it provides important information for the teen driver safety research and outreach community. Knowing who is driving unlicensed is the first step in preventing this unsafe practice in the future. The second step is developing effective interventions to reach this population of young drivers and those who influence them.
OTHER YDRI FINDINGS

The three biggest factors contributing to older child passengers dying in a crash are riding with a driver younger than age 16, not wearing safety belts, and riding on high speed roads.

- Of the nearly 10,000 child passenger deaths (ages 12 to 17) studied by YDRI researchers, more than half (54.4 percent) were riding with a driver under age 20, nearly two-thirds were unrestrained, and more than three-quarters occurred on roads with posted speed limits above 45 m.p.h.

- Passengers ages 12 to 17 are more likely to die in a car crash than younger children. This risk increases with each teenage year.

- There’s a clear tipping point that occurs between ages 12 and 14, when child passengers became much more likely to die in a crash than their younger counterparts.

Risk Factors for Death Among Older Children and Teenage Motor Vehicle Passengers. Archives of Pediatric and Adolescent Medicine, March 2008

- Teen drivers who currently smoke are more than twice as likely to have had a crash as non-smokers, even after controlling for gender, race, ethnicity, income, length of license, and geography.

- When compared to drivers who sleep eight or more hours per night, those who sleep less are about one-third more likely to have been in a crash. Moreover, those who often drive alone while drowsy are one-third more likely to have been involved in a crash.

- The connection between smoking and crash risk is not well understood, particularly involving young people. More research is needed to determine smoking’s role for future teen driver safety intervention efforts.

Teen Driver Crash Risk and Associations with Smoking and Drowsy Driving. Accident Analysis and Prevention, February 2008

- The words “good” and “safe,” frequently used in public health messaging for teen driving may not have the intended meaning. It’s not that teens don’t hear the messages; instead, they interpret them through different cultural filters. We need to better understand these filters in order to develop effective public health messages for teen driving.

- Words matter. Injury prevention specialists argue for the importance of word choice in developing teen driver safety messages. Innovative research methods enable researchers to describe some of the differences among word choices.

- The teen sample far more strongly associated safety belt use with a “safe driver” rather than a “good driver.”

Teen Perceptions of Good Drivers and Safe Drivers: Implications for Reaching Adolescents. Injury Prevention, February 2009

A CALL TO ACTION

- Promote safe teen passenger behavior. Go to ridelikeafriend.com for more information and spread the word to teens and parents.

Knowing the risks can help parents and teens make smart decisions about which rides are safe and which rides are not.
A total of 5,665 students responded to our survey. All data described in this report are weighted, meaning that the sample is representative of all U.S. public school students in the ninth through 11th grades, representing 10.6 million students. Our sample includes teens who are learning to drive and those who have been driving independently for several years, as well as those who have never driven and may be several years away from driving on their own.

Please see the Methods section on Page 23 for a more detailed description of the sampling and weighting plan.

### STUDY METHODS

- **Survey Creation** – In the fall of 2005, 45 focus groups involving nearly 300 students were conducted among diverse populations across the country. The purpose of the focus groups was to hear teens’ thoughts about the factors that make a difference in whether teens are safe in cars, and to ask them to prioritize the issues they raised. This unique student viewpoint formed the core of questions in the survey. Simultaneously, additional survey content was created based on an extensive literature review and input from an international panel of experts. Whenever possible, topics based on expert recommendations or the literature review were included as previously validated survey items. Items from the students, on the other hand, were included in their own words to ensure that their true meaning was preserved. The survey was designed as a paper-and-pencil questionnaire to be completed in less than one class period by students with an eighth-grade reading level, and responses were recorded on an optically readable answer sheet. The survey was pilot-tested in diverse schools in Illinois and Pennsylvania prior to the national launch.

- **Study Sample** – Students in public schools in grades nine through 11 were asked to participate in the survey. These grades were selected to include students who had reached the age by which many students begin to drive, as well as those students approaching that age. A nationally representative two-stage sample of schools and students was selected. The first stage, all public schools in the country were stratified into urban and rural categories. Schools were defined as urban if the ZIP code in which they were located was at least as urbanized as the median ZIP code in the U.S.; otherwise they were defined as rural. A stratified random sample of 120 schools was selected. Of these schools, 68 participated.

  The second stage of sampling consisted of randomly choosing one ninth-grade class, two 10th-grade classes and one 11th-grade class within participating schools. Tenth graders were over-sampled to provide more information about early drivers, as many students either begin their driving experience or substantially increase it in this grade.

A total of 5,665 students participated in the survey, yielding an overall student participation rate of 85 percent. When including the participation rates of both schools and the students, the overall response rate was calculated at 48 percent. When the data are weighted, the sample is representative of all 10.6 million public school students in ninth through 11th grades. Class size averaged 21 students.

- **Survey Administration** – This study would not have been possible without the participation of dozens of schools and the help of their teachers across the country who administered the survey. Standardized survey administration procedures, based on those used for the Centers for Disease Control and Prevention’s Youth Risk Behavior Surveillance Survey, were designed to protect student privacy and allow for anonymous participation. These procedures were followed at each school and in each participating classroom. Research indicates that when students know that procedures are in place to protect their privacy and to allow for anonymous participation, data of this nature can be gathered as reliably from adolescents as from adults. Internal analytical checks demonstrated strong reliability and face validity of the data collected. The survey and all associated procedures received approval from the Institutional Review Boards (IRB) of both The Children’s Hospital of Philadelphia and ORC Macro, the survey research firm that conducted the survey. An IRB is an oversight group that makes sure the rights and welfare of research participants are protected.

- **Survey Analysis** – All survey analyses were conducted at The Children’s Hospital of Philadelphia after survey data were weighted to adjust for the variable probabilities of selection and differential nonresponse, which considered gender, race/ethnicity, and grade. The sampling weights were then computed as the reciprocal of the probability of selection for students. According to design, sampling weights were approximately equal for all students in a grade in a given stratum (urban or rural). All analyses were conducted using SPSS 14.0 for Windows (SPSS Inc., Chicago, Ill.); frequency percentages were rounded to the nearest whole number.

- **Qualitative Research Sources** – The quotations in this report were excerpted from in-depth interviews conducted with more than 40 teens in seven states and focus groups conducted with nearly 450 teens in 17 states between September 2005 and May 2006.
